Test - 2

1. Explain about static testing techniques with examples

Static testing is a software testing technique which is used to check defects without executing the code. It also helps finding defects or errors that may not be found by dynamic testing.

Two main types of static techniques are,

manual examinations:-

Manual examinations includes analysis of code done manually as known as Reviews, walk throughs.

Automated Analysis

The automated analysis

are done by using tools like,

- * checkstyle
- * sourcemeter
- * lint

for example:-

Reviews

It is a static testing technique where software development artifacts like (req document, code and design documents) are examined without executing the code.

Types of Review

- * Informal Review
- * Technical Review
- * walkthrough
- * Inspections
